

introduction to non euclidean pdf

In mathematics, non-Euclidean geometry consists of two geometries based on axioms closely related to those specifying Euclidean geometry. As Euclidean geometry lies at the intersection of metric geometry and affine geometry, non-Euclidean geometry arises when either the metric requirement is relaxed, or the parallel postulate is replaced with an alternative one.

Non-Euclidean geometry - Wikipedia

Euclidean geometry is a mathematical system attributed to Alexandrian Greek mathematician Euclid, which he described in his textbook on geometry: the Elements. Euclid's method consists in assuming a small set of intuitively appealing axioms, and deducing many other propositions from these. Although many of Euclid's results had been stated by earlier mathematicians, Euclid was the first to show ...

The heuristic function $h(n)$ tells A^* an estimate of the minimum cost from any vertex n to the goal. It's important to choose a good heuristic function. Use of the Heuristic The heuristic can be used to control A^* 's behavior. At one extreme, if $h(n)$ is 0, then only $g(n)$ plays a role, and A^* turns into Dijkstra's Algorithm, which is guaranteed to find a shortest path.
