### **Kinetics of Homogeneous Multistep - sciencedirect.com**

The kinetics of a multistep reaction is described by a set of simultaneous rate equations, one for each participant. The equations are independent of one another in their algebraic forms and values of their coefficients. Each equation is the summation of the contributions from all steps in which the respective species participates.

Homogeneous catalysis is a powerful tool for the hydrogenation of olefins. One of the earliest and most efficient catalysts for effecting this transformation is Wilkinson's catalyst, chlorotris-(triphenylphosphine) rhodium,  $[(Ph_3P)_3RhCl]$ .

Thus, Kinetics of Homogeneous Multistep Reactions provides the basics of both reactor theory (e.g. batch, CSTR, plug flow, etc.) and kinetics (e.g. transition-state theory) along with the useful tools (e.g. rate-determining step, steady-state approximation) that allow the engineering and chemistry to be linked in, generally, analytical equations.

Chemical Kinetics Factors That Affect Reaction Rates  $\hat{\infty}$  Physical State of the Reactants In order to react, molecules must come in contact with each other. If the reaction is happening between a solid and a liquid it will react only on the surface. The more homogeneous the mixture of reactants, the faster the molecules can react.
